

Print_fuction: It is used to print answers.

```
In [2]: a = 10  
b = 20  
a  
b
```

Out[2]: 20

```
In [3]: a = 10  
b = 20  
print(a)  
print(b)
```

10
20

Printing result with string

```
In [10]: num1 = 20  
num2 = 30  
add = num1 + num2  
print('The addition of',num1,'and',num2, 'is=',add)
```

The addition of 20 and 30 is= 50

```
In [11]: name = 'Python'  
age = 20  
city = 'Hyd'  
print('My name is',name, 'and i am', age, 'yeras old from', city)
```

My name is Python and i am 20 yeras old from Hyd

```
In [ ]: # Print format method
```

```
In [28]: name = 'Python'  
age = 20  
city = 'Hyd'  
  
print('My name is {} and i am {} years old from {}'.format(name,age,city))
```

My name is Python and i am 20 years old from Hyd

```
In [26]: num1 = 20  
num2 = 20  
add = num1 + num2  
print('The addition {} and {} is = {}'.format(num1,num2,add))
```

The addition 20 and 20 is = 40

More short format method using (f string method)

```
In [35]: num1 = 20  
num2 = 20  
add = num1 + num2  
print(f'The addition of {num1} and {num2} is = {add}')
```

The addition of 20 and 20 is = 40

```
In [36]: num1=100
num2=25
num3=333
avg=round((num1+num2+num3)/3,2)
print(f'The avg of {num1},{num2} and {num3} is = {avg}')
```

The avg of 100,25 and 333 is = 152.67

End Statement: we will use end statement that join line from end of one string to starting of other string

```
In [38]: print('Hello Python', end= ' ')
print('Welcome to the python progrmme')
```

Hello Python Welcome to the python progrmme

```
In [ ]: # Seprator: We use (, . * - ' ', or any other sign) seprator to print only one statement.
# Inside one print statement we have multiple values.
```

```
In [47]: print('cat','hen','dog','cock','goat', sep=' ')
```

cat hen dog cock goat

```
In [45]: print('hello','hai','how are you',sep='--->')
```

hello--->hai--->how are you

```
In [49]: print('hello','hai','how are you',sep=' * ')
```

hello * hai * how are you

```
In [ ]:
```
